## Corpus of git commit related data for OpenStack Nova

#### Sources:

- Launchpad (<a href="https://launchpad.net/nova">https://launchpad.net/nova</a>)
- Gerrit (<a href="https://review.openstack.org/#/q/status:open,n,z">https://review.openstack.org/#/q/status:open,n,z</a>))
- Git (https://github.com/openstack/nova (https://github.com/openstack/nova))

#### **Structure of Corpus:**

- combined\_commits.jsonz : Basic record for each commit, integrating data from Launchpad, Gerrit and Git
- all\_blame.jsonz : Applies GIT BLAME to the parent commit of every bug fix related commit. Only includes those lines included within the window for diff. Proximity is distance of line within blame for a changed line in a bug fix commit, where proximity=1 for changed lines or lines adjacent to inserts

Note: All .jsonz files are gzipped json, with individual json entries for each record. Apply json.loads() to each individual line.

#### **Examples:**

- Sample entry from combined\_commits.jsonz
- Sample entry from all\_blame.jsonz
- Example of blame normalization

## Code to load corpus

```
In [1]: import gzip
import json
import pprint as pp
```

```
In [2]: def jload helper(f):
            #restore the object
             result = []
            dict_result = {}
             for line in f:
                    v = json.loads(line)
                     if 'json key' in v:
                         #individual entries are items in a dict:
                         k = v[']son key']
                         del v['json key']
                         dict result[k] = v
                         pass
                     else:
                         result.append(v)
             if dict result:
                print 'returning dict'
                 return dict result
            elif len(result) > 1:
                print 'returning list'
                 return result
             elif len(result) == 1:
                print 'returning singleton'
                return result[0]
             else:
                 return False
In [3]: def jload(name):
             if name.endswith('z'):
                print 'gzipped'
                with gzip.open(name,'rb') as f:
                     return jload helper(f)
             else:
                with open(name, 'rb') as f:
                     return jload helper(f)
```

# Sample entry from combined\_commits.jsonz

```
In [4]: combined_commits = jload('combined_commits.jsonz')
    gzipped
    returning dict
```

#### Basic commit entry (without corresponsing Launchpar info)

Entry associated with bug fix. 'g:' prefix is data from gerrit, 'lp:' prefix is data from launchpad. All other fields from git commit

```
In [6]: bug fix commits = [k for k,v in combined commits.items() if 'lp:id' in v]
        print 'commits associated with big fixes:', len(bug fix commits)
        print bug fix commits[0]
        print
        pp.pprint (combined commits[bug fix commits[0]] )
        commits associated with big fixes: 4456

## **Normalize Blame Entry**

Weight commits based on proximity to change. Normalize to that overall weight is 0. Normalization can either be reciprical of distance or exponential
